TYPES OF CONNECTING LINKS (JOINTS)

Proper selection of connecting link type is very important if a satisfactory chain life and safety drive are to be ensured.

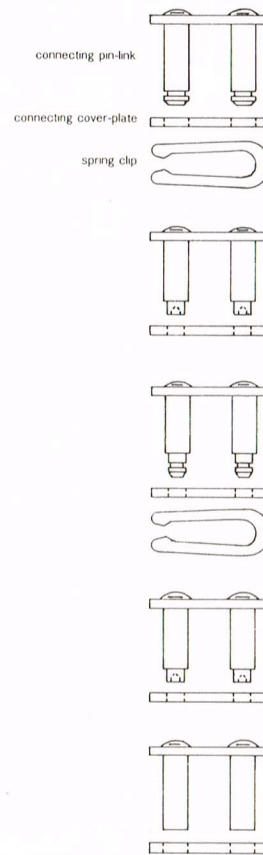

RJ : Is a clip type connecting link. Its cover-plate is designed for a slip-fit on to the pins to enable easy installation. The RJ link should only be used on small horsepower machines or low speed application because it has less strength than the regular riveted links of the chain.

XJ : Is a rivet type connecting link. Its cover-plate is designed for a heavy press-fit on to the pins. The XJ link provides virtually the same durability and resistance to fatigue as exhibited by regular riveted links of chain. On all medium and high horsepower machines, riveted connection to make the chain endless is recommended for maximum strength and safety. A riveting tool is required.

FJ : Is another clip type connecting link and its cover-plate has a light press-fit construction which gives a higher fatigue strength than the RJ link and easier installation than the XJ link. If endless chain or XJ assembly is not feasible, then a FJ link may be used. However, the FJ link has less strength than XJ and regular riveted links of chain.

LJ : Is another rivet type connecting link with slip-fit construction. The LJ link is recommended in specific cases where the other types of connecting links must be avoided for structural reason of machine.

PL : Is the pin link which should be used wherever possible as it is the connecting link which is of the same strength and construction as the regular chain link. Specify it as PL when ordering. A riveting tool is required.

CUT LENGTH CHAIN HOW TO DESCRIBE IT

On the D. I. D Chain Selector there always appear some symbols after the number of chain links. These symbols indicate whether a chain is endless or with connecting link, and what connecting link is packed in the chain box.

LE (82LE, 102LE) : a riveted endless chain in the specified number of links without a connecting link.

RB, XB, FB, LB (96RB, 96XB, 100FB, 128LB) : an open-end chain with the specified number of links including one RJ, XJ, FJ or LJ connecting link which is packed separately together with the chain in the box. All D.I.D drive chains with connecting links are now supplied in this manner unless otherwise specifically agreed.

RJ (108RJ) : an open-end chain with the specified number of links including one RJ connecting link which is attached to one end of the chain.

IMPORTANT FACTS

- To maintain proper chain life, never use more than one connecting link on the drive chain.
- Avoid the use of offset links. They do not provide the same fatigue life as the normal riveted links of the chain.
- Be certain to select the appropriate motorcycle chain, length, connecting link and assembly recommended by the original equipment manufacturer. Consult with your dealer and D.I.D Chain Selector.

CAUTION : IMPROPER SELECTION AND USE OF THE INCORRECT CHAIN MAY CAUSE DAMAGE TO THE MOTORCYCLE AND INJURY TO THE RIDERS.
