

# Absorb this:

## When it comes to shock absorbers, there's more than one kind of stability.

If you've been into motorcycles very long, you know how it goes: one month somebody comes out with a 'trick' shock, and you gotta have it, until the next month when there's a 'tricker' shock you gotta have.

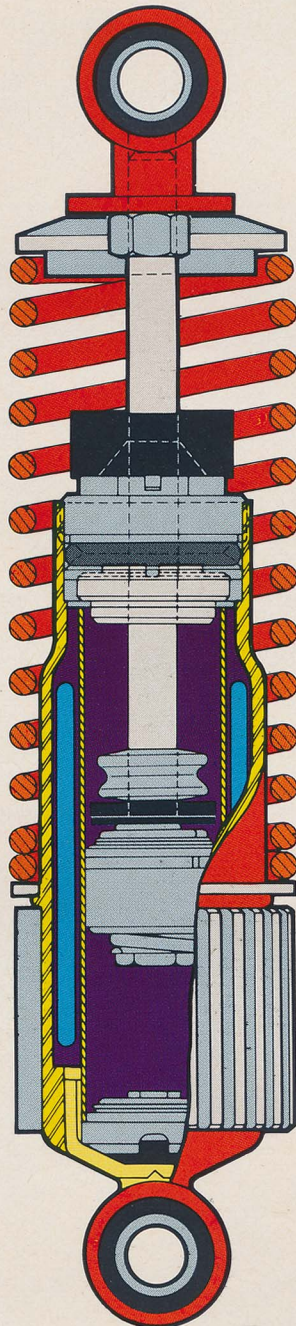

Well, the kind of stability you get from your motorcycle's suspension system is largely determined by the kind of rider you are—your weight, your riding style, the conditions you normally ride under. And there's no other rider exactly like you. All riders are different. So it stands to reason that your shock absorbers should be tuned to match your own type of riding.

Yet most original equipment shocks are set for so-called "average" riders and riding conditions. About the best you can do is adjust their spring rate for a softer or firmer ride. You can't really tune them. You're pretty much locked into "average."

Enter Mulholland.

Our shock absorbers are designed for one specific purpose: to give each rider the ability to tune his suspension for his own individual riding needs. With Mulhollands, you can not only adjust the spring rate, you can adjust the damping rate, as well. No matter what kind of riding you're into, your Mulhollands will give you a smoother ride, and more responsive handling, both of which add up to better stability.

Plus, your Mulhollands are completely rebuildable. If they become worn or damaged, you can bring them back to life with

easy to use replacement parts. And without going to mechanic's school.

For the street, you'll want Mulholland SS Shocks. For off-road play bikes, the Mulholland MX Shocks. For motocross or hard-core, slam-bam off-road riding, you just can't do better than Mulholland LTG Shocks.

Now for the most important stability of all: The company that makes your shocks. We're not going to play any tricks on you. When you buy Mulhollands, you know you have the current proven state of the art in shock absorber design. No tricks. No experiments. But stability you can trust. Period.
